

STATE CLEANUPS OF CONTAMINATED SITES ARE FAILING COMMUNITIES IMPACTED BY YEARS OF INDUSTRIAL POLLUTION

The Department of Toxic Substances Control (DTSC) provides oversight of these sites with known soil & water contamination. Soil and soil vapor testing have shown high levels of **lead, arsenic, volatile organic compounds (VOCs) like PCE, TCE, PCBs and benzene.**

Without a comprehensive and sufficient cleanup plan, these contaminants will continue harming the environment and potentially impact the respiratory, nervous, digestive and reproductive system and cause cancer.

- DTSC suspects that families living on Santa Fe Ave may be exposed to vapor intrusion.
- DTSC needs access to people's homes to do indoor air quality testing and inform residents of the potential dangers of VOCs.
- The reason for contamination is due to years of industrial and manufacturing use next to residential homes.
- To effectively address potential vapor intrusion, DTSC needs to test homes for their indoor air quality levels.
